

Electronic Products for electrical panels

February 2009 edition

UNI EN-ISO 9001

UNI EN-ISO 14001

WARNING If not specified, the technical data in this catalogue are typical and measured at 25°C (77°F), 230 Vac, Unom, Vdc and rated current; ripple is measured at 20 MHz with probe connected to 0.1 µF. The technical data in this catalogue are typical and are not binding for Cabur and may be modified without prior notice, simply for production or improvement and/or evolution reason. Please contact our technical-commercial offices for any relevant confirmation or updates. For more informations visit our web site www.cabur.eu.

Catalogue printed on FSC certified, ecological and recyclable glossy paper.

FSC (Forest Stewardship Council) is an international non-profit organization devoted to encouraging the responsible management of the world's forests through an environmentally friendly and economically sustainable policy.

Quality wins! That's guaranteed!

Quality, reliability, high technology, know-how, efficient use are all aspects and features of a product of primary importance.

For the safety and piece of mind of its Customers, Cabur designs and creates its Electronic Products with great care, using selected materials and components, in perfect harmony with the Quality choices made by the company in the last few decades. That's why we can guarantee our electronic products for five years.

Cabur's electronic products warranty

Cabur guarantees its electronic products against manufacturing defects and faults as well as defects due to their parts and/or components (except for wearable parts and/or components) for 5 years starting from the date of the shipping document issued by Cabur.

Shortly after its foundation, back in 1952, Cabur became a leading manufacturer of electrical panel terminal blocks, by focusing on installers' needs and providing leading edge technical solutions that, in some cases, would become popular in the industry.

In particular, in our product design and manufacturing, we have pioneered a quality focus on raw materials, functionality, reliability over time, and respect for the environment. That is the reason why Cabur was granted Class 1E (Equipment for Nuclear Power Generating Stations) qualification as early as in 1985 and, in addition, the ISO 9001/UNI-EN 29001 (Quality) and ISO 14001 (Environment) certifications, as well as compliance to Atex standards for "Ex e" installations on the most important terminal block lines.

UNI EN-ISO 14001

UNI EN-ISO 9001

The Headoffices

In 2006 a significant growth in company structure urged the organization to move from the historic site in Albissola Marina to a new logistic and manufacturing centre in Altare (SV).

Rather than moving abroad, Cabur has opted to invest in Italy, by acquiring a new state-of-the-art 15,000 sqm production site.

By doubling our production surface and increasing our staff with the recruitment of new people, we will be able to rationalise and make our current production processes, logistics, and sales, even more efficient.

Product range

With over 50 years of experience, Cabur develops and produces, by its own designs, a wide range of products for the electrical industry, providing the best in working conditions, in terms of operability and reliability.

Current production of:

- **Terminal blocks for electrical boards**
- **Electronic products for electrical boards**
- **Installation products**

Fully meets users' varied and complex installation needs.

Our varied and diversified production represents the optimal synthesis of Cabur's long experience as partner of Italy's most important Industries and Research Laboratories, combined with foreign activities and collaboration, always with the aim of pinpointing and meeting users' installation needs.

In addition to terminal blocks, Cabur product offering features a full range of electronic products for electric panels for plant and machine automation and process control. These products are designed for an easy deploy and for easy material management, thanks to the use of innovative and leading-edge technology.

Following an agreement with Tyco Electronics, Cabur distributes in the Italian market the HTS **heavy duty connector line**, which enlarges and completes the product range with over 250 items, presenting a series of highly qualified solutions.

HTS was selected as our partner for their strong experience in this field, their reliability and top material and finished product quality.

In particular as a result of a specific planning decision, products in our "standard" series are designed to meet the fundamental requirements of the most severe installation conditions and environments, thus avoiding to produce special product series for specific applications. This kind of planning has determined a clear qualitative improvement in the entire production, as well as a more streamlined and simplified product management, first of all to the advantage of the Distribution, which can guarantee to final Clients the most efficient service.

Highest ...mass produced quality

We guarantee top performance of our contacts and maximum flexibility of connection solutions.

A full range of standard products for automation panels is available at all major Wholesalers. Full support is provided by Cabur sales force both in Italy and in over 30 countries abroad, as well as by our Engineers, in order to provide our clients with the best installation solutions.

Web site

www.cabur.eu web site

On our web site, our customers and industry operators can always get up-to-date information on new products and sales offers.

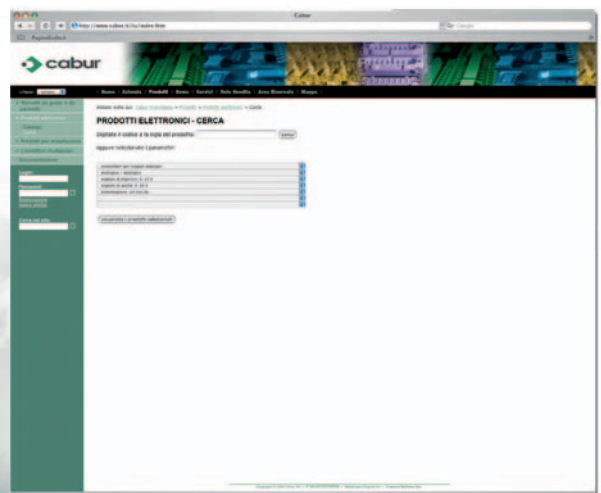

All data sheets of Cabur product range, including those in this Catalogue, are available on our online catalogue featuring advanced user-friendly search functions.

Moreover, on our web site you can:

- ask our specialists for technical information and application advice
- contact our sales staff and ask them for estimates
- download manuals and other technical literature
- get access to quality and compliance certificates
- look at our latest sales literature
- ask for free catalogues and brochures
- ... and much more.

By this newsletter, Cabur communicates also via e-mail its main innovations and commercial activities to all those who apply for it through the registration form.

In conclusion, Cabur web site (**www.cabur.eu**) is the ideal tool to get real time information and contacts with our company.

Quality and environment

ISO 9001 CSQ Certification

UNI EN-ISO 9001

Until recently, Cabur "Quality" was simply recognised through the appreciation of its customers. This has allowed the company to become a leader in Italy in the design, production and distribution of "terminal blocks for electrical panels" and, more recently, to extend its products offering to the segment of "electronic products" with recognised reliability levels in both Italian and foreign markets. Obviously, this cannot be the result of improvisation, but of a constant organisation process begun back in 1985 with the definition and implementation of a Quality Assurance Programme based on ANSI N 45.2 (referred to the particularly severe nuclear environment) that has involved the entire structure of the Company and has made each function and worker responsible for quality standards. Since 1995, CSQ (international institute for the certification of business quality systems) has certified the Quality system designed and adopted by Cabur. The Quality system refers to the most complete and severe standard amongst

UNI EN ISO 9000 series defining the requirements for Total Quality in Companies, that is ISO 9001, including the activities of Product Design, Development, Manufacturing and Customer Service. After the issue of the new Edition of the Standard (ISO 9001:2000), the whole Quality System has been revised and renewed to be fully compliant with the new regulations. This compliance was confirmed by CSQ with the new Certificate issued in 2003.

**THE QUALITY OF OUR PRODUCTS IS JUDGED BY OUR CUSTOMERS.
OUR QUALITY ASSURANCE SYSTEM IS CERTIFIED BY CSQ.**

ISO 14001 CSQ Certification

UNI EN-ISO 14001

In its continuous improvement process, CABUR has adopted an environmental management system since 2001, obtaining the international CSQ UNI EN 14001 recognition. This goal represents a guarantee given of the respect Cabur has for the surrounding environment as well as a demonstration of the adoption of environmental safeguard rules and, additionally, a pledge for constant ecological improvement. This kind of Certification is still quite uncommon in Italy; Cabur has nevertheless been able to achieve and add it to its corporate philosophy, which is always aimed at the anticipation, rather than to the passive adaptation, of those needs that are becoming more and more urgent and global. Environment is undoubtedly one of these issues and, anticipating many other companies, not only in Italy, Cabur

firmly decided to adopt a system that monitors and prevents environmental risk, inherent to every stage of its manufacturing process. Operational procedures and other paper documentation were unified and harmonised with the running Quality Assurance System and the manual, becoming of both Quality and Environmental Management, is now a complete reference point. The Quality Assurance and Environmental Management Department is at your complete disposal to provide any further information and/or clarification on the entire Quality / Environment System and Customer Service. Cabur can provide you with a copy of both CSQ and EQNET certificates, or with a copy of the Quality and Environmental Management manual.

Standards and directives

The 2002/95/CE Directive

The 2002/95/CE Directive, known as RoHS, sets limits to the use of specific dangerous materials in electric and electronic devices.

The Directive applies exclusively to devices included in the following categories, as listed in attachment 1A of 2002/96/EC Directive, also known as WEEE, excluding categories 8 and 9.

1. Large appliances excluding fixed ones
2. Small appliances
3. IT and telecommunication appliances
4. Consumers' appliances
5. Lighting appliances
6. Electric and electronic tools, excluding large fixed industrial tools
7. Toys and devices for hobbies and sports
10. Vending machines

Cabur Products' compliance to RoHS Directive

Cabur products are generally deployed in electric panels for electric distribution and for industrial automation, which are excluded from the application field of the RoHS Directive, as components of "fixed industrial tools" and of "fixed installations".

Nevertheless, in consideration of the needs of those Customers deploying Cabur products into devices and appliances that need to be RoHS compliant, we have decided to review our production according to RoHS Directive requirements.

From the beginning of the year we have been disposing of non-compliant items, not only to reduce dangerous substances but to eliminate them completely from components in our production, with a Zero Tolerance mindset.

The small amount of our products which is currently non-RoHS compliant consists of dated stocked parts or of those few items that cannot be produced by different materials or process yet. In any case, as mentioned above, these items are deployed in product categories that are not listed in the RoHS Directive application field.

Our staff is available for further details both on our products and on the application of the RoHS Directive.

For more information, please click on www.cabur.eu

CE Marking

All products in this catalogue meet all EU applicable standards when the catalogue was printed. Therefore, all required CE markings are placed on the products and on all product related documents.

Do not hesitate to contact our staff for any further information and/or explanations on Reference Standards. Cabur Customer Service can provide you with certificates of compliance to Reference Standards, type approvals, and CE markings.

Cabur power house

Cabur continues to renew and expand the range of power supplies for the use in industrial automation of vehicles, overhaul of processes and plants by improving technologies and product services and by introducing new models.

Quality and safety: Cabur is the first Italian company to obtain the special approval UL508C Industrial Control Equipment for devices used for the processes in the industrial automation, in conformity with the direction IEC950, EN60950 for Electric Safety and thus EC labelled.

Innovation and research: in 1997 Cabur was the first Italian company to produce switching power supplies for Din guide with universal input 120-230 Vac, while others were offering power supplies with outperformed, heavy and cumbersome step-down network transformer.

With the new generation of products presented in this catalogue, Cabur aimed at obtaining the highest possible output, to reduce energy costs and working temperatures although reducing the dimensions of power supplies. By increasing the output, the dissipated power is reduced and besides the duration of the power supplies it is possible to reduce the thermic stress of the components for more reliability and savings while running.

By using circuit technologies and innovative components, we obtained the highest output on the market with over 94% in three-phase. The new three-phase power supply of 20°/24V has an output of 94.5%, supplies 480 W and dissipates only 28W compared to more than 50 W dissipated in other products: 25 W saved, less heat and much more reliability.

The new generation of power supplies has all the characteristics of flexibility and functionality for use of the previous series:

- all models are adequate for a network voltage of 100-120-230-240 Vac with a range of 90...264 Vac/110...370 Vdc which makes it possible to use them all over the world
- new mono- two-phase power supplies of the CEW series with an extended range from 185...550 Vac in only one model
- the output voltage of the power supplies above 2 A can be adjusted between 24 to 27.5 Vdc
- all models supply a high output peak power (above 200% for 200 ms or 1 sec according to the model) to start the hardest loads and guarantee the selectivity of safety fuses on the 24 V line
- there are the versions with alarm contact and diode in an "o-ring" available on the output for the redundant parallel connection and all standard power supplies can be connected in parallel to sum power.

EN61000-3-2: all the models are in conformity with the EN61000-3-2 regulations of emissions of harmonic currents in low-voltage power supply systems, in force since 01/01/2001. By using our power supply systems, the user can declare the conformity of its own panel to the EMC directives without additional external EMI filters and without knowing points 1,2, 3,4 which may be unknown to the user or vary from one panel to the next or from client to client.

Thermic protection: all models are equipped with protections against overtemperature adjusted at 60° C with full load: in case of insufficient ventilation of the panel, continuous overload and high ambient temperature you avoid a broken power supply because of overheating and you reduce the thermic stress. The area of functioning of ambient temperature ranges from 20 a + 50°C for all models with full load without derating (except other indications).

Protection from short-overload: the protection from short-circuit and overload is used to protect the power supply from break down through overcurrent and subsequent overheating above the limits supported by the components. This function can be designed by starting with different applicable needs, with practical results and very different costs. In an automated process, the conditions for use, the value and the nature of the load can vary a lot, they are not known to those who project power supplies and sometimes not even to the users. The power supply in automation must reconcile needs which are in contrast between each other: protect themselves from overcurrent, but at the same time try to feed loads which call for a high peak current, work at ambient temperatures of max 45° C according to the regulation and sometimes also above in critical ventilation situations and furthermore guarantee high reliability and acceptable costs.

Choice of technology for protection of power supplies in automated processes:

- the overcurrent protection must support the high peak currents required by loads such as filament lamps, capacitive loads (dc/dc converter and filter condensators when switching on are almost a short-circuit for some ms) or inductive loads (engines in dc, electromagnets, etc.) at the peak they require currents above 5-10 times their nominal power and furthermore all these loads must sometimes be started synchronously.
 - high peak power must be supplied for a sufficient time in order to "start" the loads, for at least about ten ms or even up to 1-2 s according to the power of the power supply
 - if the power supply has a high power and supplies a number of power outlets protected by fuses, the circuit protection from the short circuit/overload must guarantee the selectivity of the operation of the protections from overcurrent by burning the fusible of the broken load before its internal protection circuit intervenes by switching off the output or reducing the voltage and output power.
 - the ambient temperature to which the project must refer to in order to measure the components, the admitted overcurrent and its duration must be equal or superior to 45°C, established in the directives regarding electric panels; the ambient temperature is a basic reference parameter because besides on supplied power and output, the heating of components depends also on ambient temperature.
- To protect the power supply you can use various techniques:
- switch off the output as soon as possible: it is safe and costs less but it does not enable you to start heavy loads or to burn fuse on the 24 Vdc line
 - constant power protection: if the admitted overcurrent is sufficiently high it enables you to start heavy loads, but if the overload lasts longer the power supply is always working with overload
 - hiccup protection: combines the two techniques listed above and admits over +200% of overcurrent for a relatively long time and then it switches off the output for a even longer break; the result is that you obtain the necessary peak of power when heavy loads are coming in with less heating of the components and during the break it cools down instead of being in continuous overload such as it is the case for protections with constant power.

The protection with Hiccup technology with overcurrent output admitted up to +200% of the nominal power for a time duration between 200ms to over 1s (according to the power of the model) which has shown to be effective and reliable in practice for many processes in the field of automation.

Environment and RoHS conformity: as our products are not included in the RoHS WEEE directive, Cabur has adapted its own products. Cabur is one of the first Italian companies to obtain the International Environmental Certificate UNI EN ISO 14001, certified by CSQ on ecologically compatible treatment of all materials necessary during the working cycle in order to produce its own products.

Filtered power supplies: a few components for a simple, reliable and economic solution in order to supply engines in dc or loads able to work without problems also with reciprocating wastage relatively high in output (ripple) and variations of output voltage equal to $\pm 10\%$, due to the variations of loads and variations of network. The filtered power supplies supply continuous non-stabilized voltage and if combined with underdimensioned transformers, in cases where the load calls for high power with a simultaneous decrease of the network voltage, the output voltage can decrease remarkably and cause a disfunctioning of the supplied devices. They are not recommended in case of a network voltage which cannot guarantee major stability or a voltage at least equal to $\pm 10\%$ of the nominal voltage provided by the regulations.

Linear power supplies: Cabur produces linear power supplies with small power and high performance, reliability and an acceptable price. The linear power supplies make only a small part of the market and are offered as standard products, even though the performance of the high quality switching technology permits to realize compact power supplies with a very superior performance.

"Custom" power supplies: Cabur plans and produces "custom" power supplies on request of the client to be able to meet the requirements of the directives and the high demands. Furthermore our lab offers a technical documentation and the measures which prove the conformity of the products with the directives on Electric Safety and Electromagnetic compatibility, besides the necessary technical support to define the characteristics of the product on the basis of the client's needs and our own experience.

Cabur offers three different technologies with the right performance and price

	Switching	Linear	Filtered
Efficiency	>87%	< 50%	80%
Energy dissipated	14%	> 50%	20%
Mains var. tolerance	90-264 Vac	207-257 Vac	218-240 Vac
Load var. stability	> ± 50 mV	> ± 200 mV	> ± 2.5 V
Ripple	@ 100 mV _{pp}	@ 100 mV _{pp}	≥ 2 V _{pp}
Weight	reduced	high	high
Dimensions	small	high	high
Cost	higher	higher	low
EMI	below standard limits	low	low

Which power supply unit to use

- Switching**
- with highly variable line voltages (from 90 to 246 Vac)
 - with electronic loads
 - when high Vdc stability is required
 - to reduce energy consumption, dissipated heat, weight, dimensions
- Linear**
- with line voltages stable within +10%
 - with electronic loads
 - for applications requiring very low electromagnetic emissions
- Filtered**
- with very stable line voltages within +5%
 - with loads having high tolerance to high ripple
 - with loads having high tolerance to variations of 25 Vdc
 - to reduce costs

GENERAL NOTES

All technical data indicated in this catalogue are "typical", and are measured at 25°C, rated input voltage, rated output voltage and current, after 10 min warm up; ripple is measured at rated input and output, 20 MHz, probe on 100 nF.

Length of insulation stripping: 9 mm, model with fixed terminals; 6 mm, model with pluggable terminals.

Cooling: distance the power supply units 2 cm (1") from adjacent devices and at least 5 cm (2") from other equipment on the upper and lower sides.

We recommend to mount the power supply on horizontal DIN rails.

Assembly: the power supply units are equipped with an EN 50.022 guide fitting. For a better stability we recommend attaching the guide to the panel, also in the point where the power supply unit is to be mounted.

DC input supply voltage: it is possible to supply the input of 90...264 Vac wide range models with 100...370 Vdc following these indications: reduce output current 25%, min. input DC voltage 100 Vdc, respect input polarity indicated on instruction sheet. Models with double voltage input cannot be supplied with DC voltage lower than 220 Vdc.

Redundant parallel and parallel connection: models with the letter P in their type and Cat. No. are supplied as standard with the output protection diode for redundant parallel and parallel connection.

We recommend adjusting to the same voltage (tolerance + 50 mV) the outputs of all the power supply units, applying the same calibration load, before connecting them in parallel and using power supply units of the same model. If two power supply units not provided with an internal diode (standard versions) have to be connected in parallel, the connection shown in Figure 1 has to be applied out.

The CSDB module allows to connect in redundant parallel power supplies with 12, 15, 24 and 48 Vdc output voltages up to 15 A total max.

Connection in series of two power supply units: possible by connecting a diode in anti-parallel to the output of each power supply unit, dimensioned to withstand the max. current of the power supply unit (see Figure 2).

Dual voltage output power supplies: if a specific model with dual output is not available, dual output voltage can be achieved by connecting the outputs of two power supply unit as in Figure 3.

Power good signal available on "P" models: failure signal is provided by a 1A /30 Vdc SPST or SPDT contact (depending on model) of an internal relay: contact is closed when

functions are all OK, contact is opened in case of AC line shut off, overload or short circuit on 24 Vdc line or power supply failure.

NOTES FOR POWER SUPPLY UNITS WITH TRANSFORMER SECONDARY INPUT

Isolation: this series of power supply units is not isolated.

Type of use: they are suitable for use in PELV (one pole of the Protective Extra Low Voltage earthed) and SELV (Safety Extra Low Voltage, no pole earthed). The transformer used must have double or reinforced isolation in accordance with CEI 14.6 / EN 60742.

In the case of use in PELV circuits, only earth one pole of the 24 Vdc of the power supply unit. In the case of use in SELV circuits, do not earth the input earth terminal.

figure 3

Do not connect to the negative pole of the power supply output (- Vdc) together with one pole of the AC secondary source; this condition will damage the power supply; the secondary output voltage of the transformer must be kept isolated from ground and only the negative pole of the power supply output can be grounded for safety.

Modular switching power supply CSD series

DOMOTIC POWER

Domotic Power series

It includes single-phase switching supplies with up to 75W for applications in civil and industrial automation.

Its housing is designed adopting the sizes of DIN standard modular products for units integrated into modular control panels and may also be used in standard switchboards or small-depth panels.

Suggested uses

- Applications in industrial automation
- Applications in civil automation
- General applications in systems fit into small remote panels

Main features

- The 90...264 Vac and 110...370 Vdc input makes them suitable for use on all power supply lines.
- These power supplies are Insulation Class 2, thus they don't require grounding, which reduces costs and times during installation into remote panels, surveillance and monitoring systems.
- Their high efficiency reduces energy consumption and working temperature and allows their use in small panels.
- Their backup power allows the supply of continuous current at least +25% above the rated value up to 45°C without exceeding standard temperature limits and ensuring safety and reliability.
- Dimensioned power supply and surge protection supplying breakaway starting currents 150% above the rated value required by heavy loads.
- Thermal protection prevents faults caused by prolonged overload at high ambient temperatures.
- Their internal components' high efficiency and excellent ventilation offer small dimensions and IP20 protection against accidental contacts in compliance with IEC529.

Single-phase switching power supply 120-230 Vac output power 15 W

- Single-phase input 90...264 Vac and DC 100...370 Vdc
- Short circuit, overload, over temperature, input overvoltage protections
- Isolation Class 2, no grounding needed
- Compact dimensions
- Suitable for applications in SELV and PELV circuits

NOTES

- The depth dimension includes the DIN rail clamp.
- (2) Over 50°C (122°F) apply a derating: C version: -0.015 A/°C;
B version: -0.03 A/°C.
- (3) Overload and short circuit current depends on the total line resistance

Switching power supply CSF series

COOL POWER

Cool Power series

It includes DIN-rail single-phase switching power supplies, specifically designed for applications in industrial automation and process control switchboards and panels. They can supply 50% above the rated voltage for more than 5 sec. keeping the output voltage constant and the alarm contact controlled by a voltage threshold switching over when the voltage drops 90% below the rated value. **Thanks to these features and to the numerous international certifications, this series of power supplies allows engineers to meet with all the requirements of the new EN 60204-1 Machinery Directive.**

Suggested uses

- Applications in industrial automation requiring high levels of efficiency and reliability
- Applications requiring selectivity of surge protection devices on DC lines.
- Application in machinery automation requiring high levels of reliability in terms of control and safety voltage
- Applications in process control
- Heavy duty uses
- Applications in civil automation

Main features

- The 90...264 Vac and 110...370 Vdc input makes them suitable for use on all power supply lines.
- Threshold alarm contact warning when the voltage drops 90% below the rated value.
- Versions with integrated Oring diode for redundant parallel connections, avoiding the use of external devices and reducing dimensions and installation costs.
- Their high efficiency reduces energy consumption and components' operating temperature allowing their use in small panels and under severe ambient conditions.
- Their backup power allows the supply of current and voltage at least +50% above the rated value at 45°C for a few minutes without exceeding standard temperature limits and ensuring safety and reliability.
- The output voltage may be adjusted and the output is protected against the input of surges coming from the DC line and caused by inductive loads.
- The output is equipped with double electronic protection devices preventing dangerous voltages which may damage powered components in the event of internal faults.
- Thermal protection prevents faults in the event of prolonged overloads at high ambient temperatures.
- Their design ensures excellent ventilation to internal components, small dimensions and IP20 protection against accidental contacts in compliance with IEC529.
- Thanks to their high efficiency and excellent ventilation, they are the smallest devices available on the market.

Single-phase switching power supply 120-230 Vac output power 30 W

- Single-phase input 90...264 Vac and DC 100...370 Vdc
- Short circuit, overload, over temperature protection
- Isolation Class 2, no grounding needed
- Compact dimensions
- Suitable for applications in SELV and PELV circuits

NOTES

The depth dimension includes the DIN rail clamp.

- (1) Version available upon request; for information call our sales department, local agent or representative
- (2) With 100...127 Vdc input voltage, constant output power and $T_a > 45^\circ\text{C}$, the output current must be derated by 25%
- (3) Over 50°C (122°F) apply a derating: C version: $-0.03 \text{ A}/^\circ\text{C}$; B version: $-0.038 \text{ A}/^\circ\text{C}$; F version: $-0.013 \text{ A}/^\circ\text{C}$
- (4) Overload and short circuit current depends on the total line resistance.

PR/3/AC, PR/3/AC/ZB, PR/3/AS, PR/3/AS/ZB

Single-phase switching power supply 120-230 Vac output power 192...240 W

- Single-phase input 120 and 230 Vac
- Short circuit, overload, over temperature, input and output overvoltage protections
- High outrush current to guarantee downstream overcurrent protections selectivity and to start-up heavy loads
- Suitable for applications in SELV and PELV circuits
- High efficiency and low dissipated power

NOTES

- The depth dimension includes the terminal blocks and the DIN clamp.
- (2) Double input selectable with external jumper, DC supply allow only between 300 and 350 Vdc
- (3) Over 45°C (113°F) apply derating: CSF10-CSF10P: -0.16 A/°C; B version: -0.27 A/°C; D version: -0.08 A/°C
- (4) Overload and short circuit current depends on the total line resistance.

Switching power supply CSP series

EASY POWER

Easy Power series

It includes DIN-rail single-phase switching power supplies for general automation and installation applications. They are the recommended low-cost choice for uses where loads do not require high breakaway starting currents.

Suggested uses

- Applications in civil automation
- General applications in the installation of systems

Main features

- Equipped with 120 - 230 Vac input, they are suitable for use in all single-phase networks.
- Their high efficiency reduces energy consumption and components' operating temperature allowing their use in small panels and under severe ambient conditions.
- Backup power +20% above the rated voltage up to 45°C without exceeding standard temperature limits and ensuring safety and reliability.
- The output voltage may be adjusted and is protected against the input of surges caused by inductive loads on the DC line and is equipped with double electronic protection devices preventing damages to powered equipment in the event of internal faults.
- Short-circuit, overload and thermal protection devices prevent faults in the event of prolonged overloads at high ambient temperatures.
- Their design ensures excellent ventilation to internal components, very small dimensions and IP20 protection against accidental contacts in compliance with IEC529.
- Compared to other products having similar power and costs, they offer higher performances, functions and reliability.

Single-phase switching power supply 120-230 Vac output power 85 W

- Single-phase input 90...264 Vac and DC 100...370 Vdc
- Short circuit, overload, over temperature, input and output overvoltage protections
- Suitable in civil automation and general applications in the installation of systems
- Suitable for applications in SELV and PELV circuits

NOTES

The depth dimension includes the terminal blocks and the DIN clamp.
 (2) With 100...127 Vdc input voltage, constant output power and $T_a > 45^\circ\text{C}$, the output current must be derated by 25%
 (3) Over 45°C (113°F) apply a derating of $-0.05\text{ A}/^\circ\text{C}$
 (4) Overload and short circuit current depends on the total line resistance.

Single-phase switching power supply 120-230 Vac output power 240 W

- Single-phase input 120 and 230 Vac
- Short circuit, overload, over temperature, input and output overvoltage protections
- Suitable in civil automation and general applications in the installation of systems
- Suitable for applications in SELV and PELV circuits

NOTES

- The depth dimension includes the terminal blocks and the DIN clamp.
- (2) Double input selectable with external jumper, DC supply allow only between 300 and 350 Vdc
- (3) Over 45°C (113°F) apply a derating of -0.083 A/°C
- (4) Overload and short circuit current depends on the total line resistance.

Switching power supply GSW series

UNIVERSAL POWER

Universal Power Series

It includes DIN-rail single/two-phase switching power supplies with 185...550 Vac universal input for applications in industrial automation and process control. The input circuit's technology protects them against surges caused by faults in three-phase networks with neutral, increasing the application's reliability.

Suggested uses

- In single or three-phase systems requiring great flexibility
- Applications in industrial automation and process control
- Heavy duty uses
- Applications in civil automation

Main features

- The wide-range input 185...550 Vac may be supplied single-phase 230...240 Vac, two-phase 208 Vac and two-phase 400...500 Vac ensuring excellent adaptability to AC networks and enabling to get rid of the isolating transformer.
- The two-phase input enables to reduce dimensions, wiring, installation costs and space inside the panel.
- They enable to get rid of the transformer for adapting to power voltages.
- Versions with DC OK alarm contact.
- Their high efficiency reduces energy consumption and components' operating temperature allowing their use in small panels and under severe ambient conditions.
- Great backup power allowing to supply at least + 30% above the rated voltage for 5 seconds, up to 45°C without exceeding standard temperature limits and ensuring safety and reliability.
- The output voltage may be adjusted and is protected against the input of surges on the DC line and is equipped with double electronic protection devices disconnecting output in the event of internal faults.
- Dimensioned short-circuit and overload protection supplying breakaway starting currents 150% above the rated value required by heavy loads; thermal protection prevents failures in the event of prolonged overloads at high ambient temperatures.
- Their design ensures excellent ventilation to internal components, very small dimensions and IP20 protection against accidental contacts in compliance with IEC529.
- Thanks to their high efficiency and excellent ventilation, they are the smallest devices available on the market.

Greater reliability

Compared to single-phase power supplies, this Series is more reliable in industrial applications. The input stage uses components with 900 V operating voltage, which are more resistant to voltage peaks in industrial power lines compared to components used in single-phase supplies, whose operating voltage is 550V in high-quality power supplies, but often 400...450 V in low-cost products.

Being able to work from 185 to 550 Vac, these power supplies are immune to power failures; at 230 Vac input (L1-N), when another device connected to L2-N goes short, the neutral rises up to approx. 400 Vac and the input is supplied phase/phase until the protection is activated, which takes place - at best - in 300 ms; this is one of the most common causes of damages to 230-Vac single-phase power supplies in industrial applications.

Another example of faults in 230-Vac single-phase devices powered between phase-neutral is due to the disconnection or accidental interruption of the panel's neutral from the system's neutral: failing to return to the neutral point, the neutral rises up to phase voltage applying approx. 400 Vac to single-phase loads, inevitably damaging the system.

Typical application with three-phase network and neutral. The latter is used to obtain a 230-Vac voltage in order to supply power to loads (in the example, a simple bulb) and power supplies.

A simple short-circuit on the load causes a rise in the neutral's potential, all the devices connected to it will be powered between two phases, i.e. with a value of approx. 340...400 Vac instead of 230 Vac.

1 or 2-phase switching power supply 230-400-500 Vac output power 120 W

- Both single-phase and two-phase input 185...550 Vac
- High reliability and immunity against over voltage due to failures on AC line
- Short circuit, overload, over temperature, input and output overvoltage protections
- High inrush current to guarantee downstream overcurrent protections selectivity and to start-up heavy loads
- High efficiency and low dissipated power
- Suitable for applications in SELV and PELV circuits

NOTES

The depth dimension includes the terminal blocks and the DIN clamp.

- (1) Version available upon request; for information call our sales department, local agent or representative
- (2) 550 Vdc max for UL508
- (3) Over 50°C (122°F) apply a derating of about 3 W/°C
- (4) Overload and short circuit current depends on the total line resistance.

Switching power supply CSB and CSG series

TRIPLE POWER

Triple Power series

It includes 400...500 Vac single-phase and three-phase switching power supplies for applications in industrial automation.

They can supply + 50% breakaway starting current above the rated voltage for 5 seconds, keeping output voltage constant and ensuring power supply to the system. They are equipped with an alarm contact controlled by a voltage threshold switching over when the voltage drops 90% below the rated value. **Thanks to these features and to the numerous international certifications, this series of power supplies allows engineers to meet with all the requirements of the new EN 60204-1 Machinery Directive.**

Suggested uses

- Applications in machinery automation requiring high levels of reliability in terms of control and safety voltage
- In applications requiring selectivity of surge protection devices on DC lines
- Applications in industrial automation
- Heavy duty uses

Main features

- Equipped with 340...550 Vac / 507...770 Vdc, they are suitable for use on all power lines.
- Their high efficiency reduces energy consumption and components' operating temperature allowing their use in small panels and under severe ambient conditions.
- Great backup power allowing to supply at least + 50% above the rated voltage for 5 seconds, keeping output voltage constant up to 45°C without exceeding standard temperature limits and ensuring safety and reliability.
- The output voltage may be adjusted and is protected against the input of surges on the DC line and is equipped with double electronic protection devices preventing damages to powered components in the event of internal faults.
- Dimensioned short-circuit and overload protection supplying breakaway starting currents 150% above the rated value required by heavy loads.
- Thermal protection prevents faults in the event of prolonged overloads at high ambient temperatures.
- Their design ensures excellent ventilation to internal components, very small dimensions and IP20 protection against accidental contacts in compliance with IEC529.

2-phase switching power supply 400-500 Vac output power 85 W

- Two-phase input 340...550 Vac
- It saves cabling costs and line protection costs
- Short circuit, overload, over temperature, input and output overvoltage protections
- High inrush current to guarantee downstream overcurrent protections selectivity and to start-up heavy loads
- High efficiency and low dissipated power
- Suitable for applications in SELV and PELV circuits

NOTES

vertical on rail, allow 10 mm spacing between adjacent components

PR/3/AC, PR/3/AC/ZB, PR/3/AS, PR/3/AS/ZB

3-phase switching power supply 400-500 Vac output power 240 W

- Three-phase input 340...550 Vac or two-phase with derating
- Short circuit, overload, over temperature, input and output overvoltage protections
- High outburst current to guarantee downstream overcurrent protections selectivity and to start-up heavy loads
- High efficiency and low dissipated power
- Suitable for applications in SELV and PELV circuits

NOTES

- The depth dimension includes the DIN rail clamp.
- (2) 550 Vdc max for UL508
- (3) Over 50°C (122°F) apply a derating of about 3.75 W/°C
- (4) Overload and short circuit current depends on the total line resistance.

BLOCK DIAGRAM

Items sold until sell-out,
will be replaced by **CSG240** series...

DC/DC Insulated converters output power 120 W

- DC wide range input
- Short circuit, overload, over temperature protection
- Compact design

NOTES

The depth dimension includes the terminal blocks and the DIN clamp.

(1) Inrush current is measured with input supplied by a battery; the current peak vary depending on the internal impedance of the current source and depending on cables and connections resistance.

(2) Over 50°C (122°F) apply a derating -3 W/°C, max 60°C

(3) According to EN60950 insulation tests on input side must be made only with DC instruments.

APPLICATIONS

CSE power supplies are suitable for use in SELV and PELV circuits.

WARNING! In PELV circuits, in which one safety low voltage pole is connected to the ground, **a pole of the secondary of the transformer too must not be connected to ground at once**; the only one pole to be grounded is normally the negative of the 24 Vdc output of the power supply and effectively used as control voltage.

The connection to ground of one pole of the transformer Vac output together with one pole of the 24 Vdc of the power supply output damages the power supply.

Input and output of the CSE Series power supplies are not isolated. Safety isolation function is therefore assigned to the external transformer which has to comply with EN60742 Std.

APPLICATIONS

The CL-R linear regulated power supply series of CABUR is provided with adjustable output and it can satisfy all those needs related to the feeding of small loads with non-standard rated voltage and at an extremely limited cost. It can be mounted on the rail in whatever position, providing that enough space for the free circulation of the air remains for the cooling; the CL1R model having an IP 00 protection degree, its use is intended inside a protected enclosure. Even if the power supply is protected from over-current it is advisable to respect the rated values shown in table 1 and 2.

(1) CL1R and CL5R give the rated performances if fed by a voltage between 24 and 27 Vac, as indicated on **Tab. 1**; with input voltage between 24 and 27 Vac, the maximum output current for output voltages lower than 24 Vdc are indicated on **Tab. 2**; to achieve a good voltage stabilization and low ripple, linear power supplies must be fed with an input voltage higher than output voltage, while if they are supplied with 24 Vac, and adjusted for 24 Vdc output, when rated current is supplied, the ripple increases and voltage stabilization decreases; input voltages higher than 27 Vac increases power dissipation and increases operating temperature of the component, and might cause thermal protection shut down. The products are preadjusted to Vout 24 Vdc with Vin 26 Vac.

APPLICATIONS

A rectified and filtered power supply is made with a rectifier bridge and a filter capacitor, that converts the alternating voltage into a continuous voltage. Since the power supply unit is not regulated, the output voltage varies considerably according to the current required by the load and according to the ±10% mains voltage variations.

The formula indicated in the output specifications allows to calculate the output voltage with Zero load, with 50% load and full load. This allows you to choose the most suitable transformer for your needs.

These units offer a low cost and a reliable voltage source suitable for loads such as relays, contactors, solenoid valves or loads that can work with relatively high ripple and wide voltage variations; in applications where mains is unstable or troubled, it might be not suitable to feed microprocessor devices, analog converters, encoders and electronic devices which are sensitive to voltage variations.

APPLICATIONS

A rectified and filtered power supply is made with a rectifier bridge and a filter capacitor, that converts the alternating voltage into a continuous voltage. Since the power supply unit is not regulated, the output voltage varies considerably according to the current required by the load and according to the ±10% mains voltage variations.

The formula indicated in the output specifications allows to calculate the output voltage with Zero load, with 50% load and full load. This allows you to choose the most suitable transformer for your needs.

These units offer a low cost and a reliable voltage source suitable for loads such as relays, contactors, solenoid valves or loads that can work with relatively high ripple and wide voltage variations; in applications where mains is unstable or troubled, it might be not suitable to feed microprocessor devices, analog converters, encoders and electronic devices which are sensitive to voltage variations.

APPLICATIONS

1. Battery charger

With this module is possible to use a Cabur power supply as a battery charger while it is feeding the load.

The diode provides decoupling between the battery and the power supply; the resistance limits the current charge limiting power supply output current and assuring longer life to the battery. The F1 fuse protects the battery and its wiring against short circuit.

The next picture shows the connections.

2. Parallel connection of power supplies

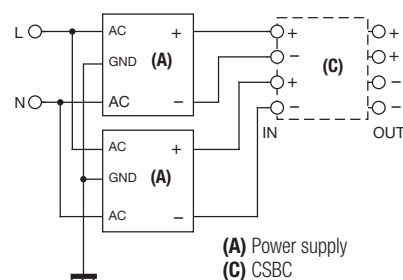

It is possible to use this module also to connect two power supplies in parallel, not provided with output decoupling diode, eliminating "Fuse 2" in series to charging current limiting resistor.

The next picture shows the connections.

APPLICATIONS

All power supplies with adjustable output voltage to +15% of rated voltage can be used as lead battery chargers, suitable to be used as back up supply in case of AC line breakdown.

The CS-UPS-1 circuit regulate the current charging the battery, and it is possible to set it up to 2A or 4A charging current ; CS- UPS1 disconnects the load from the battery whenever the battery voltage drops under 19Vdc, to avoid total discharge which always shortens battery life.

The module is provided with a fuse protecting the battery and its cable to prevent fire risk in case of short circuit. The module is provided with the following leds display:

PS OK: The green LED is on when the power supply feeding the CS-UPS1 is OK and the load is supplied by the power supply while the battery is continuously charged.

LOAD OK: Yellow LED is on when CS-UPS1 feeds the load.

BATT. OK: Green LED is on when the power supply is turned OFF or disconnected and indicates that the battery is connected and can feed the load.

BATT. LOW: Red LED on when the battery is low or discharged.

REVERSE BATTERY: Red LED is on when battery is connected with reverse polarity.

Alarm contact: a relay with an SPDT contact 1A/24V switches when the load is no more supplied by the power supply and then is supplied by the battery. This contact allows to get a remote warning on the status of the system even in the case that the power supply is turned OFF or damaged, or non more supplied for any reasons.

Batteries holder module

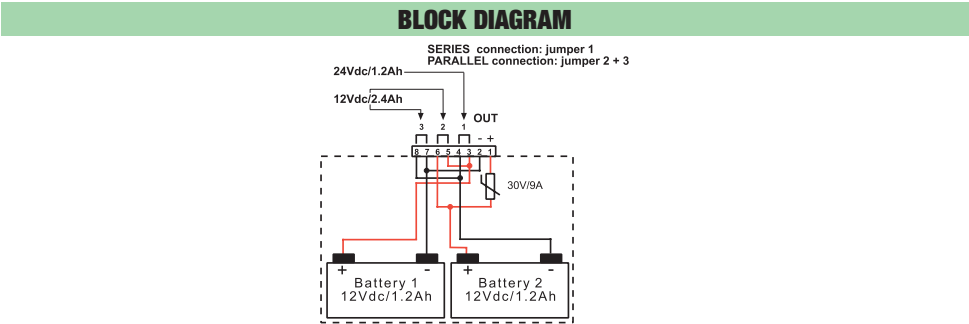

- 12 or 24 Vdc selectable output voltage
- Suitable for sealed lead rechargeable batteries
- Suitable for CSBC, CS-UPS, CSC75
- Suitable for DIN rail installation

Surge Protection Devices

Surge Protection Devices

The MA3000 Series surge protection devices prevent surges and transient overvoltages conducted through AC power distribution boards from damaging electronic systems such as instrumentation control panels, telemetry substations and fire and security alarm installations. The JVS operates by limiting excess voltages to suitable lower levels for the equipment previewed for employment in Overvoltage Category II (2.5 kV), in Class C overvoltage security zone, like requested by the Standards IEC 1024, IEC 1312-1, EN 50083-1.

Where to mount the SPDs

According to actual standards, the JVS overvoltage protection device has to be installed on the AC supply line at the very input of control cabinets, to guarantee surge immunity of all the devices installed in the panel, such as PLC, power supplies, inverters etc. The conformity to EMC Standards applies also to control cabinets, and requires that the max residual overvoltage does not exceed 2.5 kV. As a consequence, it is mandatory to install overvoltage protection devices capable to reduce incoming overvoltages under 2.5 kV, and overvoltage level that the devices inside the cabinet can withstand without damage.

JVS Series

The surge protection device is made of a DIN rail mounted socket equipped with double connection terminal blocks and a pluggable module containing the overvoltage protection circuitry. This feature makes it easy to remove the protection device during isolation tests and for quick replacement. The MA 3000 can withstand a 20 times 10 kA discharge current (waveform 8/20), and a single 40 kA (JVS1-C1P) and 70 kA (JVS1-E1P) peak current. As required by industry surge protection device standards, the MA3000 series is provided with a disconnection device that removes the SPD from the line in case of internal damage or short circuit, giving a visible failure display on the front panel of the unit (picture no. 2). After a great number of discharges and continued long service the module will lose protection capacity and can be replaced without disconnecting the circuit wiring.

Fuse and protection devices

The MA3000 Series surge protective devices are not designed with a built-in thermal disconnecter, therefore they must be equipped with upstream protection against short-circuit currents and with a differential protection element for protection against indirect contact (generally already present in the installation). The MA3000 Series must not be installed downstream of high sensitivity differential protection devices.

Connections

The surge protection devices MA3000 series can be employed in these types of connections:

Protection takes priority

Continuity of services takes priority

Lightning protection zones

Zone 0 - Zone where items are subject to direct lightning strikes or where an unattenuated electromagnetic field occurs as a result of the strike.

Zone 1 - Zone where items are subject to low level direct lightning strikes. The conducted impulse lightning currents and/or switching surges are reduced compared with Zone 0.

Zone 2 - Remnants of lightning impulse currents and/or switching surges are reduced compared with Zone 1.

Zone 3 - Surges, caused by oscillation effects, magnetic field couplings and internal switching surges are reduced compared with Zone 2

A - Sub Station
B - Main distribution board
C - Heavy machinery
D - Local distribution board
E - Light machinery
F - Workstation

APPLICATIONS

The JVS Series surge protection devices prevent surges and transient overvoltages conducted through AC power distribution boards from damaging electronic devices and electronic control systems used in process control, factory automation, machinery automation and electric systems in general.

In case of local or remote lightning strokes, JVS surge suppressors limit the residual overvoltage to values coordinated with Overvoltage Category II, as used on most electronic control systems, panels and electronic devices such as PLCs, DCSs, industrial PCs, power supplies and motor drives or any other electronic devices.

Adjustable electronic overcurrent protection from 1...10 A / 24 Vdc

According to the new EN60204-1 Std. it is **compulsory** to protect wires on SELV-PELV lines against the effects of surges. The standard requires that surge protection devices on 24Vdc cut the fault off before the 24 Vdc control drops below 21.6 V, disconnecting power to controls and preventing the starting of emergency and safety functions.

According to EN 60204-1 and EN 61131-1 and -2, surge protection devices on SELV-PELV lines must be able to disconnect shorts within 10ms and dangerous surges within 5s. The use of power supplies with high output surge capacity and precise and quick protection devices enables to cut faults off before 24V drops below 21.6V disconnecting power to controls.

Fuses and magneto-thermic switches on 24 Vdc lines do not have I / t features enabling to quickly and precisely cut faults off; moreover fuses may be replaced with different types thus altering the system's protection and safety.

The correct coordination of the circuitry into which the surge protection device is incorporated must take into account the line's total R: R connections + R wires + R protection + residual R of the damaged load. R total value must always enable that the protection device's tripping current may flow in the circuit; it is also important to avoid undersizing the protection device in order to prevent inconvenient trips due to the load's breakaway starting I, or oversizing it thus increasing t of intervention.

The whole circuitry made up of power supply, surge protection device, wires and connections must be designed so as to enable the safe interruption of surges within 5s before 24 Vdc drops below 21.6 Vdc. This condition may be met using Cabur's power supplies - series CSF and CSG - dimensioned to supply high output surge (>+50% of rat.I for >5s) and electronic surge protection devices with CEP System which are more precise and quicker than magneto-thermic switches and devices whose tripping t does not depend upon ambient T and may be reset with local or remote controls.

Features of protection devices

Mgts have two different intervention curves: Thermal and Magnetic. The magnetic relay trips exclusively in the event of a short with different I / t curves: thermal relays have all the same intervention curve, regardless of the mgt curve and in the event of a surge, they operate as described in figure 2: surge currents $1.13 \times I_n$ are cut in >1h and with surges $> 1.45 \times I_n$, the tripping takes place in a few minutes.

The disconnection of short currents is carried out by a magnetic relay whose tripping t goes from 0.01 to 0.1 sec, with very high currents which the power supply may not be able to supply; an mgt C5 used on DC has >70A safe tripping, a current that only power supplies with much higher rated I, i.e. 40A, may be able to supply (and not all of them) and that can not be supplied by 10A power supplies.

Using mgt as surge protection device, if the power supply has a surge I 1.2 times its rat. I, disconnection will take place in 20...60 min, while with 2.5 currents higher than rat.I it will take place between 25 sec. and 2 min., depending on amb.T., whose times are too long to ensure the stability of 24V, for protecting wires and the selectivity of protection devices. In the event of a failure - until the protection device trips - the power supply remains with a higher surge of $I_n \times 1.5 \times 5s$ and 24V drops below 21.6V leaving standard functions and most of all safety functions with no power supply.

Selectivity of protection devices

In the event of a surge or a short, only the damaged circuit is disconnected by its protection device with no repercussions on the supply of the other loads. This function is obtained with power supplies having high surge capacity and quick and precise protection devices.

CEP system - a smart system for current's control

CEP "recognizes" surges at their lowest and more precise stage and disconnects the damaged circuit as quickly as possible. For an excellent flexible use, the CEP system allows to set 10 tripping currents ranging from 1A to 10A in 1A steps and 3 intervention curves "Fast - Normal - Delayed" (see figure 3).

The protection status is displayed by two leds and by a remote alarm transistor output; the load may be activated / deactivated by pressing a button on the front (figure 5) or by the PLC remote control. The possibility of separately controlling single channels is useful during installation, because the various components may be separately activated and tested and - in big systems - the remote control may be used in order to gradually activate loads thus preventing simultaneous overloads when the system is started up. Another important features in terms of safety is the possibility of manually disconnecting the load, which means that even when protection devices are reset from the remote control, the load will remain inactive thus preventing dangerous situations.

3-phase filter without neutral TDV series

- Models from 7 to 130 A
- High attenuation from 50 kHz to 30 MHz
- High attenuation also with long cables
- Minimum space on the panel

NOTES

Dimensions and diagrams are indicative, for more details see the products data sheet.

(1) According to EN60950 insulation tests on input side must be made only with DC instruments.

Double-cell single-phase filter DP series

- Models from 3 to 30 A
- High attenuation from 150 kHz to 30 MHz
- High attenuation also with long cables
- Minimum space on the panel

NOTES

Dimensions and diagrams are indicative, for more details see the products data sheet.

- (1) 0.25 mA @ 115 Vac e 0.45 mA @ 250 Vac for models from 3...20 A - 1 mA @ 115 Vac e 2 mA @ 250 Vac for the model of 30 A.
- (2) According to EN60950 insulation tests on input side must be made only with DC instruments.
- (3) With flat plug for models from 3...20 A – with screw bolt for the model from 30 A.

Analog converters

Applications of analog converters and galvanic isolation

These convert electric signals generated by sensors for measuring physical quantities such as: temperature (RTD thermocouples and PT100 thermal resistors), frequency (proximity, contacts, photoelectric cells), current (HV, Hall sensors), resistance (potentiometers), voltage, pressure, level etc., into standardised electrical signals, adapting them to the I/O of industrial PLC's, DCS's, and PC's (control), or they convert a given analog signal into a different one, adapting it to the inputs/outputs of the control, or allow remote transmission of the signal without interference via galvanic isolation (Fig. 1).

fig. 1

Adaptation between sensor output signal and control input signal:

physical quantity measured	sensor output	converter input		converter output	
Temperature	Normally one of the signals indicated in the next column	0 – 60 mV	±60 mV	0 – 5 V	±5 V
Frequency		0 – 100 mV	±100 mV	0 – 10 V	±10 V
Current		0 – 500 mV	±500 mV	0 – 20 mA	±20 mA
Resistance		0 – 1 V	±1 V	4 – 20 mA	
Voltage		0 – 5 V	±5 V		
Pressure		0 – 10 V	±10 V		
Level measurement		0 – 5 mA	±5 mA		
		0 – 10 mA	±10 mA		
	0 – 20 mA	±20 mA			
		0 – 20 mA			

Remote transmission of the signal:

The voltage signals reach a max. distance of 10-20 m, beyond this they lose reliability and become very sensitive to earth and induced interference (to transmit at a distance > 20 m a voltage signal must be converted into a current signal and galvanically isolated) (Fig. 2).

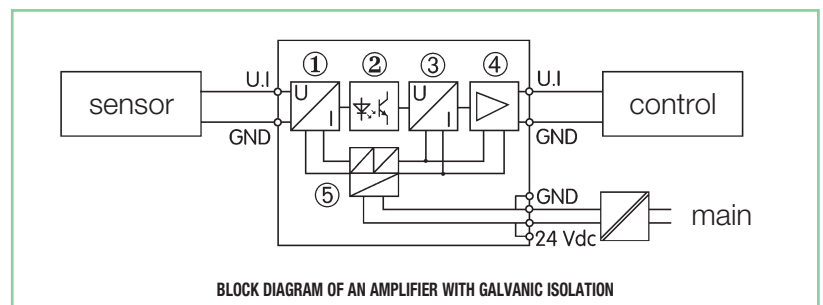

fig. 2

- current signals exceed 300 m of transmission distance and are less sensitive to induced interference. In order to transmit a current signal at a distance galvanic isolation is required.

- ① Input amplifier
- ② Opto-isolator
- ③ Signal adapter
- ④ Output amplifier
- ⑤ DC/DC converter

Galvanic isolation of the signal:

- electrically isolates and separates the circuit of the sensor from the control and power supply circuits. Thus each circuit operates with reference to its own zero potential which, being isolated from other circuits, cannot be altered by differences in potential always present between different earth references (Figs. 3 and 4).

fig. 3

fig. 4

- isolates and separates the various zero potentials between power supply, control and sensors/actuators;
- allows transmission of the signal without errors or interference and with greater reliability;
- the higher the isolation (in KV), the greater the security of transmission where there are zero potentials, electromagnetic interference, transients (lightning, discharges etc.) (Fig. 5).

fig. 5

Galvanic isolation is necessary when:

- the distance between control and sensor/actuator is more than 20 m;
- the earth references are different;
- the zero potentials are high, or potentially high in the case of discharges or earth dispersed currents;
- electromagnetic interference is present;
- the signal cables are wired in conduits with power cables (Fig. 6).

fig. 6

Analog converters selection table

These tables allow you to quickly select only the items, then check if all product's technical data meet your application requirements.

Max. input current	30 mA

OUTPUT TECHNICAL DATA

Output signal (1)	7 programmable ranges (see Table 2)
Applicable load (voltage / current model)	≥ 10 KΩ / ≤ 500 Ω
Max. output voltage	12 V
Max. output current	25 mA

GENERAL TECHNICAL DATA

Supply voltage	15...36 Vdc
Rated current	100 mA max. @ 24 Vdc
Auxiliary DC feed output max. current	5 mA @ 5 Vdc / 30 mA @ 15 Vdc
Gain error	< 0.1 % FS
Offset error	< 0.05 % FS
Linearity error	< 0.1 % FS
Zero adjustment / Span adjustment	± 10 % FS
Transmission frequency	400Hz...1kHz according to full-scale
Rise time	150 mV / μs
Bandwidth	1 kHz @ -6 dB
Phase delay	< 10 μs
I/O / supply isolation	> 3 kVAc / 60 s
Continuous voltage isolation	800 Vac max.
Reference Standard	IEC 664-1, DIN VDE0110.1
Overvoltage category/Pollution degree	III / 2
Operating temperature range	-10... +65°C
Δ T	5°C
Protection degree	IP 20 IEC 529, EN60529
ECM standards	EN 50081-2, EN 50082-2
Connection terminal	2.5 mm ² pluggable screw type (14 AWG)
Housing material	polyamide UL94V-0
Approx. weight	150 g (5.29 oz)
Mounting information	vertical on rail, allow 5 mm spacing between adjacent component

MOUNTING ACCESSORIES

Mounting rail type according to IEC60715/TH35-7.5	PR/3/AC, PR/3/AC/ZB, PR/3/AS, PR/3/AS/ZB
Mounting rail type according to IEC60715/G32	—
Plug-in jumper	—

blue	—

INPUT STAGE

The module can manage single-pole and two-pole inputs, choosing from among the ranges (see Table 1):

- 0...60 mV ± 60 mV
- 0...100 mV ± 100 mV
- 0...500 mV ± 500 mV
- 0...1 V ± 1 V
- 0...5 V ± 5 V
- 0...10 V ± 10 V
- 0...5 mA ± 5 mA
- 0...10 mA ± 10 mA
- 0...20 mA ± 20 mA
- 4...20 mA

The input stage provides two auxiliary supply outputs, for feeding loop powered sensor and potentiometer directly from the module (5 V and 15 V).

Example of connection:

OUTPUT STAGE

The module supplies in output single-pole and two-pole signals with the following ranges (see Table 2):

- 0...5 V ± 5 V
- 0...10 V ± 10 V
- 0...20 mA ± 20 mA
- 4...20 mA

Programmable analog signal converters

- 3 ways galvanic isolation
- 14 programmable input range
- 3 programmable output range
- Simple programming
- Available version with 24-240 Vac/dc supply voltage

NOTES

The dimensions include the DIN clamp.
 (1) Adjustable via rotary-switch
 (2) Adjustable via dip-switch
 (3) range 16.8...30 Vdc / 19.2...28.8 Vac
 (4) range 16.8...264 Vdc / 19.2...264 Vac
 (5) 3-way isolation: IN/OUT/power supply

APPLICATIONS

Multifunction converters can be used to convert and isolate the most common standard analog signals; the input of the modules can be set up into 14 signal ranges and the output can be set for up to 3 most important analog ranges. The set up is possible by simply switching the position of a dip switch on the side of the module.

The many different input / output combinations offered by multifunctions modules allows to reduce inventory for both new and replacement products and provides many signal conversion solutions.

The "3 ways" galvanic isolation assures total isolation between input, output and supply input; this feature, and the "self calibrating signal circuitry", gives excellent accuracy without any manual adjustment.

If a single signal must provide several output channels it is possible to use many modules connecting their inputs in parallel as long as the signal is voltage, or in series when signal is current.

APPLICATIONS

Multi-function converters can be used to convert and isolate the most common standard analog signals; the input and the output can be set up into 3 different signal ranges. The set up is possible by simply switching the position of a dip switch on the side of the module.

The input / output combinations offered by these modules provide the most common input/output configurations more economically when compared to 14 input / 3 output modules and reduces inventory.

The "2 way" galvanic isolation assures isolation only between input and output signal, the supply input has the negative pole in common with the output signal; this feature, and the "self calibrating signal circuitry", gives excellent accuracy without any manual adjustment.

These modules are the right solution in applications where analog converter are mounted in the same cabinet with PLC, DCS and CN, and when they are powered by the same supply; in this case they allow a cost reduction compared with 3 way fully isolated modules.

If a single signal must provide several output channels it is possible to use many modules connecting their inputs in parallel as long as the signal is voltage, or in series when the signal is current.

APPLICATIONS

These converters can be used to convert and isolate the most common standard analog signals; each model is designed for a single input output signal function, and they are the right solution in applications where many modules handling the same signal are used, where they allow a large cost reduction compared with multi function modules. These modules are provided with 3 ways galvanic isolation between input output and supply voltage. If a single signal must provide several output channels it is possible to use many modules connecting their inputs in parallel as long as the signal is voltage, or in series when the signal is current

APPLICATIONS

The passive galvanic isolators can isolate the signal generated by loop powered sensors, where the applied load must have a resistance lower than 400 Ω 20 mA, including the cable resistance; the applied input voltage has to be higher than 2.7 V compared with output voltage (see note 2). If above conditions are satisfied, passive isolators reduce cabling costs and eliminate power supplies thereby saving costs. If above conditions are not satisfied, passive module introduces a signal attenuation.

APPLICATIONS

These modules convert an analog signal into a 24V square wave frequency signal. They can be used to control motor drives, speed counters and in all those cases where an analog signal must be converted into a frequency. High input sensitivity and high accuracy conversion make it possible to convert into a stable and accurate frequency, the lowest input signals of few mV.

<400 Ω with output current
green LED = OK, flashing LED = error

APPLICATIONS

CSWTPR 7-0890 is a temperature to analog signal conversion module that provides high accuracy measurement and that can be connected to a really wide range of temperature sensors. The module can be used for a temperature range from -200 to +2.400°C. In case of failure of the sensor or short circuits on the cable, the module generates a signal that allows to get a back up safety function.

With resistive sensors it is possible to select among 2, 3, 4 wire connections. With 3 or 4 wires sensors it assures the "broken wire" function and a short circuit on sensor cables. It is also possible the redundant connection of thermocouples to the module, to increase reliability of the measurement system. Input and output are provided with over voltage protections.

APPLICATIONS

The modules convert and isolate signals generated by 3 wire / 2 wire PT100 (RTD) sensors into analog signals; the module can be set into 8 temperature ranges and for up to 3 most important analog ranges. Set up is easily achieved by setting a dip-switch on one side of the module. The modules provide input and output isolation, assuring high signal accuracy, and can be used with isolated and not isolated sensors. Two wire sensors can be used by connecting a jumper wire between 1 and 4 terminal blocks.

Programmable converters for thermocouples

- Converters for sensors with thermocouples J and K type
- 3 ways galvanic isolation

APPLICATIONS

Small control systems are used in simple applications. For economical reasons they often integrate digital inputs instead of analog inputs. The Temperature/Frequency converters offer a simple and economical solution to measure and convert temperatures, exploiting the digital inputs of the small control systems.

Current to threshold converters

- For AC current measure
- Adjustable threshold value
- Versions with transistor or relay output

APPLICATIONS

This module converts a current flowing through circuit into a threshold that can be adjusted by the potentiometer; when the current reaches the threshold value, the relay (or the transistor in the CCIS model) switches; the wire must be feed through the hole of the current sensor for current detection.

In model CCIS-1 the output will have "high" value (24 Vdc) for current higher than the threshold and "low" value (0 Vdc) for current lower than the threshold. The output is internally re-hooked to ground through a 10 k resistor, besides it is protected against overloads.

In model CCIS-R the relay will be turned on for current below the threshold, turned off for current over the threshold.

The output has all the contacts of an SPDT relay, the relay is also pluggable to allow its substitution in case of wear of the contacts.

APPLICATIONS

In 99 mm depth measure is included the space occupied by the terminal block provided with the product. Through a "HALL" sensor they grant AC/DC current measurements.

The presence of current in a circuit indicates not only that power is supplied but also that the circuit is closed and the load connected and active.

It's also possible to know the work conditions of the circuit.

The module guarantees galvanic isolation between the current conductor and the analog output and, if not connected in series to the controlled current, cannot be damaged by power surges or short circuits.

APPLICATIONS

This module is used to convert a frequency signal, with either sinusoidal or square waveform, into a standard analog signal (eg. 0...10 V, 0...20 mA, 4...20 mA). A microprocessor provides a high resolution, high stability and accuracy output signal and a dip switch gives the possibility to select a calibrated range of frequency measurement from 0 ... 100 Hz up to 0...28.8 kHz.

Analog to digital signal converters

APPLICATIONS

It allows to convert analog input signals into digital 8 bit output signal, suitable to be used with the less expensive digital inputs of any PLC. The 8 bit signal stored in the LATCH memory is controlled by HOLD signal input. If HOLD is active, the memory does not convert any new signal from the input, and keeps the last stored signal which can be supplied to the output when the module receives a control signal on the bus, allowing connection in parallel of more modules.

APPLICATIONS

The modules were designed above all for two examples of application:

1. Threshold value signal

With the aid of a trimmer integrated in the module, a threshold value is set. The base is represented by the input signal of the connected sensor.

If the input signal reaches the nominal value set, a relay is enabled in the output stage. By means of a dip-switch, energisation or de-energisation of the relay can be selected on reaching the nominal value.

2. Minimum/maximum function

Having regulated the threshold, regulation of the hysteresis allows a non-intervention zone to be set between the minimum and maximum, of variable extent.

The relay does not operate on a threshold as constant on/off, but only if the upper and lower limits defined by the hysteresis set are exceeded.

On the THRESHOLD VALUE and HYSTERESIS terminals the limit value set can be displayed with the aid of an external voltmeter. The indication of this measuring instrument also allows the value to be read when setting the threshold and hysteresis values. If several switching points are required, there is the possibility of connecting the appliances with current input (in series).

vertical on rail adjacent without gap

APPLICATIONS

These devices amplify the output signal of a measuring bridge and convert it in a standard analog signal (for example, 0...10 V, 0...20 mA, 4...20 mA). Suitable for pressure sensors, for load cells, strain gauges and other measuring bridges.
They have a high impedance differential input, bipolar I/O, and they supply the measuring bridge with an accurate auxiliary voltage. Moreover they are protected from short circuit, polarity inversion and from overvoltage up to 40 Vdc.

CWBK 7-0803 Cat. No. X766803
CWBK 7-0804 Cat. No. X766804

APPLICATIONS

For the highest accuracy of electronic measurements in process control and automation systems, a stable supply source is required to feed reference voltages. Accuracy of position sensors, such as linear or rotary potentiometers, depends greatly on the stability and accuracy of the DC supply of the sensor. For this reason our modules are provided with a calibrated DC output dedicated to feed the sensor for the highest accuracy, and this feature also helps to save space and the cost of an external DC supply source.

NPN and PNP signal polarity inverter

- Converts a NPN sensor in a PNP sensor and vice versa
- Compact design

NOTES

The dimensions include the terminal blocks and the DIN clamp.
(1) range 17...30 Vdc

BLOCK DIAGRAM

VERSIONS

Cat. No. XNPNPNP

CI-NPN/PNP

APPLICATIONS

It converts signal form PNP sensors into NPN signal and vice versa. It allows to adapt the PLC inputs to all sensors on the market, regardless of their output polarity, and it is a great help for maintenance and allows in any case a quick replacement of failed sensors when you need a PNP sensor but you have a NPN type.

DPDT single relay AC input series CM

- Pluggable relay
- Mounting on DIN rail or panel through central screw
- Compact dimensions
- Cross and slotted screws
- Screw type jumper available

NOTES

The height dimension includes 35 mm DIN rail.

(1) Relay model is not binding, they may be modified without prior warning. The technical data shown here is to be considered typical.

CK system interface

The CK series is a collection of interfaces for sensors and actuators, is composed by a wide range of electromechanical relay and solid state relay modules and passive interfaces in modular housings, which are only 6 mm wide thus saving valuable space. All products are mounted inside the CK housing, which is also available for use as a housing for custom. The CK housing can be equipped with six 2.5 mm spring-clamp terminals and four contacts for the insertion of a PTC parallel connection bridge, which provides for quick and easy circuit bridging and saves space and harness time.

The product range is currently composed by:

- Single electromechanical relay with 6 A/250 Vac SPDT protected with replaceable fuse, status Led display on front panel, AC/DC input and positive or negative common on relay coil.
- Double electromechanical relay with 5 A/250 Vac SPST (NO), two status LED displays on front panel, AC/DC input and positive or negative common on relay coil.
- Single solid state relay for common negative load, 5 A /48 Vdc output current, protected with replaceable fuse, status LED display on front panel and positive or negative common on input.
- Double solid state relay suitable for 12-24 Vdc 2.5 A loads, status LED display on front panel and positive or negative common of the input and output as well.
- Diode-holder modules with common anode (CK...AC) or common cathode (CK...CC).
- Lamp and LED test modules.
- Supply connection and distribution modules with LED display.

Composition of an interface with the CK System:

- The required modules must be selected and mounted on the DIN rail.
- The common poles of inputs and outputs can be connected in parallel using the fast connection bridges **PTC/CK/42**.
- For the connection of inputs and outputs of the relay module interface, we recommend to use the **CKF** supply distribution module: it allows to connect and distribute the feeding potential to inputs and outputs on all adjacent modules; the CKF module can be mounted as first module, or even better, in the middle position of the interfaces assembly, to divide 50+50% the current on the bridge and to reduce voltage drop and heating; the CKF- is available with LED for ON display, and is equipped with four 2.5 mm / AWG 26 ÷ 14 / 24 A rated spring-clamp terminals - input and output.
- In order to assure the IP XXB protection degree, the last module must be protected and insulated using the **CK/PT** end section.
- Main technical data and BLOCK DIAGRAM are printed on one side of each module; for individual terminal block marking, CNU/8 marking tags are available; CNU/8 marking tags are available in blank format for plotter or pen marking, or in CK dedicated series bearing numbers and/or symbols and allow to have 4, 8, 16 relay interface modules, each one individually marked on all poles.
- If the input and output power supply cables of the interface assembly are directly connected to eg. the first module, two cables must be connected on a single terminal block (feeding wire and load wire) forcing to reduce the cross-section of each conductor to less than 2,5 mm; consequently, this means a current and a reduction of the total number of relay modules that can be fed; the problem can be solved by using the CKF feeder distribution module as described in the third point.

Easy Bridge system

The fast connection bridge **PTC/CK/42** has 42 poles, and a rated current of 32 A; WARNING: the total current is limited by the rated current of the spring-clamp terminal block (24 A): if a PTC/CK serves 10 relays, a rated current of 2,4 A can be distributed on to each relay.

The use of PTC/CK bridges is simple and cost effective; the following instructions must be followed:

- after having cut the PTC/CK/42-pole bar according to required number of poles, in order to maintain the IPXXB protection degree the bar must be sheared in proximity of the end poles (see pictures 1 and 2);
- insert the jumper in the slot of the CK terminals (see picture 3);
- by using the blade of a screwdriver, the PTC bridge must be pushed down until it snaps into the female contacts; in case of long jumpers, the operation shall be started by pushing the bridge in the middle, then gradually on left / right sides; the jumper will then result completely IPXXB insulated (see picture 4);
- to remove the jumper, the blade of a screwdriver shall be inserted into the slot provided in the upper side of the PTC bridge, then lifted up and finally extracted; in case of long jumpers, the bridge shall be lifted in the middle, then gradually on left / right sides (pictures 5 and 6).

24 Vdc relay modules

CKR series

- Built-in replaceable contact protection fuse
- AC/DC common negative or positive input
- Status LED display, reverse polarity protection, crow-bar diode
- 6 mm wide
- Plug-in jumper available

NOTES

- (1) The contact rated voltage is 250 Vac; max operating voltage of the contact of the module is 50 Vac-Vdc, limited by the voltage ratings of the adopted type of fuse, which is rated for ≤ 50 Vac-75 Vdc SELV voltages; WARNING: if used with higher voltage, it does not guarantee breaking power and thus safety, and IP protection degree is lowered to IP 00; fuses with higher current ratings are not allowed and do not protect the contact against short circuit and overcurrents
- (2) Version available upon request.
- (3) In order to assure the IP20 protection degree, the last module must be protected and insulated using the CK/PT end section.

Relay modules AC/DC input series CWRE

- Pluggable relay
- Status LED display
- 6.2 mm wide
- Plug-in jumper available

NOTES

The height dimension includes 35 mm DIN rail.

- (1) Version available upon request; for information call our sales department, local agent or representative.
- (2) Relay model is not binding, they may be modified without prior warning. The technical data shown here is to be considered typical.

APPLICAZIONI

The CWRE series is suitable for the commutation of signals and is equipped with a pull-out relay to make the maintenance operations easy. Furthermore this series offers the possibility to execute the parallel on both the input and output side by the means of a proper comb jumper.

24 Vac/dc SPDT relay modules universal control voltage with fuse

- DC and AC control voltage
- Positive or negative control voltage
- Status LED display
- Pluggable relay
- Output contact with protection fuse

NOTES

The height dimension includes 35 mm DIN rail. (1) Relay model is not binding, they may be modified without prior warning. The technical data shown here is to be considered typical. (2) The interface is supplied without a fuse and the screw plug of the fuse-holder is provided in a bag inside the packaging. The fuse must be dimensioned according to load. The max. value of 6.3 A is referred to EN60127-complying fuses and the homologation rated current of the fuseholder. Fuses of a higher value may damage the fuseholder and module.

This series of products allows piloting with alternating and direct current, in which case only positive control is possible. We also recommend cutting JP jumpers if piloting takes place via low-current devices (e.g. proximity sensors).
On both versions it is possible the temporary turn on of the relay by pushing the relative button.
On model RD08124 it is possible to switch on the relays permanently with a Dip-Switch.

Solid state 12-24 Vdc single relay with fuse

- 5 A / 24 Vdc rated current
- Common negative or positive input
- Overload, short-circuit protected output with replaceable fuse
- Status LED display, reverse polarity protection
- 6 mm wide
- Plug-in jumper available

NOTES

(1) (1) The fast blow-out fuse is calibrated to protect the output stage of the module and it is connected in series to the positive pole; it is possible to replace the fuse with lower rated current values, selected to protect also the load and its wires; a fuse having a current rating higher than 5 A does not protect the output against short circuit and overloads.
(2) In order to assure the IP20 protection degree, the last module must be protected and insulated using the CK/P.T end section.

Solid state 12-24 Vdc single relay with electronic

- Electronic protection from short circuit, overload, overtemperature
- Input and output status LED
- Output extravoltage suppressor diode
- Extralow current absorbing
- Plug-in jumper available

NOTES

- (1) Maximum output current of each channel depends on surrounding air temperature, on the number of output contemporarily active and on the current flowing through them; the given value is measured with 4 active outputs and 4 not active
- (2) All outputs are overcurrent and overtemperature; when ovd or ovt protections cuts off the output current, the output display led turns off or reduces its light depending on ovd degree; the output turns on automatically when the ovd or ovt are removed.

**Solid state 12-24 Vdc
single relay
with electronic SPDT**

- 10...40 Vdc rated voltage
- Output with SPDT simulation
- Output voltage 5...48 Vdc 500 mA
- Max switching frequency 1 KHz
- I/O isolation 3.75 KV

NOTES

Compared with standard relays, solid state relays offers many advantages: much longer life, higher switching frequency, lower EMI emissions, higher vibrations withstand capability, wider input voltage range and 70% lower input current. The output of solid state relays is a N.O. type "contact" and up to now SPDT type was not available, forcing to use a standard relay when SPDT function was required. Thanks to a new technology, this new solid state relay offers all the advatages of solid state relays with a SPDT contact output type, making a step ahead possible.

- Status LED display
- 5, 12 and 24 rated voltage
- I/O isolation

CE

NEW
cabur

CE

NOTES

(1) Version available upon request.
CKS1S can isolate I/O high frequency signal circuits (encoders, counters etc.) to eliminate influence of different ground reference voltages and ground loops, thus reducing EMI noise influence on signal transmission of sensitive signals; it is always recommended to use balanced type shielded cables (two signal wires + shield); at transmission frequencies higher than 25 Hz the LED light appears constant, it is to be intended as "transmission ON" signal.

Mounting rail type according to IEC60715/G32	PR/DIN/AC - PR/DIN/AS - PR/DIN/AL
Replacement relay (1)	Cat. No. 8904404
Screw type jumper	—

Solid state 24 Vdc relay modules with electronic protection

- Rated current output 8 x 2.5 A / 5 - 33 Vdc
- Short circuit, overload, over temperature, overvoltage output protection
- 12-24 Vdc negative common input, 8 status LED K1 and K8
- 8 output status LED, input/output anti polarity inversion diodes
- 70 mm wide

NOTES

- (1) Maximum output current of each channel depends on surrounding air temperature, on the number of output contemporarily active and on the current flowing through them; the given value is measured with 4 active outputs and 4 not active.
- (2) All outputs are overcurrent and overtemperature; when ovd or ovt protections cuts off the output current, the output display led turns off or reduce its light depending on ovd degree; the output turns on automatically when the ovd or ovt are removed.

Component-holders modules CCM series

- Compact dimensions
- Available with fast-on connection

NOTES

The component-holders modules allow the montage of electronic components (diodes, resistors, capacitors etc.) according to customer needs.

They are available with connections with terminal blocks or Faston, and with holes of different diameters for the terminals of the components.

(1) Version available upon request; for info call our sales dept., local agent or representative

Distribution modules CKF series

- Terminal blocks having a rated current of 24 A and 250 Vac rated voltage
- Four slots for four parallel connections
- Available with and without LED status display
- 6 mm wide

NOTES

- 1) Modules without output status LED display allow the distribution of any voltage up to 250 V
- 2) Modules with output status LED display allow the distribution of 12-24 Vac/dc voltage and are available on request; modules suitable for 48 Vac/dc, 120 Vac/dc with status LED display are available upon request
- (3) In order to assure the IP20 protection degree, the last module must be protected and insulated using the CK/PT end section

APPLICATIONS

The use of the CKF modules for the connection and distribution of the common input and output supplies allows of to feed a maximum number of modules which is limited by the 24 A maximum current allowed by its 2.5mm² (AWG 26-14) terminal blocks; calculation of the distributed maximum current must consider the maximum simultaneous activation of all relays; if the distributed current exceeds 24 A, it will be necessary to divide it on more CKF modules.

Modular diodes-holder modules CKD series

- Easily expandable modules by means of a jumper
- Jumper insertion possibility on each of the 4 levels
- 6 mm wide

NOTES

- (1) In this model 1N4007 type diodes are mounted, their maximum average forward rectifier current is 1 A @ 50°C and 0.75 A @ 100°C. A model with BY255 type diodes and with an average forward rectifier current of 3 A @ 50°C, is also available but only upon request
- (2) In order to assure the IP20 protection degree, the last module must be protected and insulated using the CK/PT end section

APPLICATIONS

With the CK series modular housings, Cabur offers a modular system that provides housings with increasing dimensions in width for simple components as diodes, resistors or more complex circuits with or without the support of a printed circuit board. For the composition of an housing the following items are necessary:

- a base support element, available in two versions: CKB and CKBG; the latter is provided with an electric metal contact on the DIN rail that allows to connect the internal circuit to the ground. Ground contact towards the DIN rail can carry an impulsive current value of 5 KA (8/20 peak). Both models have an external width of 6 mm and internal width of 5 mm; they are also equipped with 6 springclamp terminal blocks and 4 slots for the insertion of a jumper;
- one or more CKBX2 type expansion modules similar to the base support element, having therefore an external width of 6 mm and a central slot that allows the housing of the bulky components with a height exceeding the overall height of the base support element; the expansion module is also equipped with 6 spring-clamp terminal blocks and 4 slots for the insertion of a jumper;
- the CK/S front cover, granting access to the interior of the product, is also available. Once in open position it has such a dimension in order to guarantee a IPXXB degree of protection, even when it is not employed;
- in order to assure the IPXXB protection degree, the last module must be protected and insulated using the CK/PT end section;
- the CK/PCB printed circuit board is also available; it is useful in low volume custom applications where a special pcb is not designed and also where one requires a prototype without tooling a special printed circuit board.

Plug-in jumper for CK series

Notes:

- (1) Example of a pre-cut 9 position jumper
- (2) CK/PT end section must be mounted on last module to assure IP20 protection degree
- (3) 32 A is the maximum current; however this value is limited by the rated current of the spring-clamp terminal blocks down to 24 A; for instance, having a jumper of 11 poles (1 for common and 10 for distribution) a current of 2.4 A can be distributed on every poles

Marking system CNU/8 series

Notes:

These are the tags suited to be used for the marking of the terminals on CK series, supplied in tables of 100 elements. They are manufactured in white polyamide and are provided with black printing; to be applied directly into position either before or after assembling the relays to the din rail. They have a 6 mm standard pitch and are 8 mm high. In the table below the types suited to be used with CK interface modules are listed; they are available in numbers or symbols marking patterns. For the complete range, please refer to the terminal blocks catalogue on the accessories section.
